

DATA SHEET - Personal Evacuation Device (PED) 6

The PED-6 is designed to protect against falling by controlling descent. The PED-6 system is a single use portable self-rescue device (Complex to re-thread the unit. This would make it impractical for multiple evacuation using the same device. However a trained individual can reset the device as required. The device enables an individual to descend from an offshore installation or other high location in an emergency situation under the users control by feeding the tape through the device by hand and by controlling the speed with varying pressure and angle of webbing into the device. The device is all contained within a small bag and contains all that is needed to descend safely. Each PED-6 unit is made to a highest standard from materials which give reliable performance and minimal maintenance.

Standard: EN341:2011/D

Weight of Device: 2.00kg inc (30m webbing + Bag)

Maximum Rated: 150kg

Minimum Rated: 50kg

Available Lengths: 10 to 110m

Main Body Material: Hi-Grade Anodised Aluminium With Marine grade certified shackle

Life Line Material: 15mm Tubular Polyester Webbing

Incorporating: Swivel; Anchor hook and anchor choke sling Optional reservoir bags for leg, waist or other connection; optional triangle or rescue harness, connector from unit to person; vacuum packed if required; reflective sections on Triangle, harness and reservoir bags
